

Checkpoint 2- Play test Observation Notes

Introduction: During this playtest, our main goal was to gather information from our peers regarding playability, level switching, color themes, and general reactions to playing the game. Feedback was taken through both written and verbal communication during playtesting. For this checkpoint, testers were checking to see if collisions, movement, gravity, and levels were implemented.

Note: Our collision detection hasn't been finished yet, leading to gravity being shortened. This meant that the player wouldn't fall forever and would instead land at the same y-axis as the jump. This was done to make the game testable.

Negatives during playtesting	Positives during playtesting?	How do we fix this?
Users gave feedback that the lack of Collision visuals made it hard to understand if the game was working correctly. Players also expressed concern that the jumps in the game might be unrealistic and too hard, and to do another playtest while coding to change block heights and obstacle distances. The main points of concern that all 4 group members noticed go as the following: - A lack of obstacles - The boss level spawn point was confusing - Gravity wasn't "fully" implemented yet - Jump was the space bar which they didn't figure out until we explained it to them - Mobs were not represented by blocks yet, which made it so that only levels were presented	Users gave mixed feedback while testing. Some of them said that the gravity felt unrealistic, but after explaining that the gravity was cut short for the purposes of playtesting, they agreed it was fine. We also heard that our color choices were really easy on the eyes and fun to play with. - The color scheme was complimented many times - Our jump (as short as it was) was mentioned to be realistic in that it followed an almost parabolic shape - The game length seemed perfect	We plan on fixing our game by doing the following: - Implement collision via inheritance of solid and passable objects - Fix gravity to always be present - o Do this once collision is finished - Create layers for the CSV levels. This can make it so that certain objects can be picked up - Add mobs to the CSV files so that future playtests can be more accurate to what the game should look like - Create gliding as a subset of jumping

- The first level had a color issue with the tower with blocks being colored black for some reason	- The levels moved as needed	
--	------------------------------	--

Takeaways: We were behind schedule and as such were unable to get feedback on our player collisions. When we get further along with our game, we need to make sure that players know that the space key is the jumping mechanism. Overall, however, our team felt that the play testers enjoyed the theme and visuals of our game and aim to have all our deliverables done by the next playtest.
