

Checkpoint 3 – Play Test Observation Notes

Introduction: During this playtest, our main goal was to gather information from our peers regarding the playability, aesthetics, mechanics, and general thoughts when playing the game. Our feedback was taken through both written and verbal communication when the play testers were playing our game. We also showcased sprites that hadn't been implemented into the game yet. For this checkpoint, testers were mainly checking how our sprites worked with our game and if they fit the visual and technical appeal.

Negatives during play testing	Positives during play testing	Plan to Fix issues
Users gave feedback mainly regarding the lack of sprites that we have implemented in our game. This resulted in a lot of players finding our game not as fun/interesting to play as there was nothing unique to look at in terms of visuals. We did show of some of our sprites in Piskel which received positive reactions, but there were still some comments made Feedback: - The player sprite shape might end up being inconsistent with other mobs - The walking animation is used for all movement when it shouldn't be used for climbing and other actions - Enemies need appropriate hit boxes	Users gave feedback mainly regarding the individual sprites/tiles for our game. They thought that individually they looked nice, but combination was necessary to see wat it would look like in the context of the game. We also noticed that people like our level design and thought that it was going to be interesting considering our choice of tiles used.	We plan to fix these issues with our game by: - Having someone get started on the code now so that there is time to implement interactions for all sprites - Clarify what exact design choices are being made with each sprite - Focus all our time on getting the player sprite/mechanics done then working on other things - Focus on getting versions of all sprites instead of making them all look very good now - Plan the color scheme better to fit with the player sprite

so that they can be damaged properly - Although the art is similar, it is still clear that different people drew different sprites	
-	

Takeaways: We weren't completed with all of the requirements of the checkpoint. However, our feedback was useful to gauge the appeal of the sprites we were working on. The main thing that we need to work on the visual harmony between each sprite and work on the new hitboxes/interactions that these sprites will have.
